

Conclusion

Even when files are encrypted and transferred through a secure protocol, data is still at risk if files, file servers and user credentials are stored within the DMZ.

A gateway removes that risk because it facilitates file transfers directly between trading partners and organizations without allowing direct access to an organization's private network.

As critical data breaches continue to make news, many organizations are searching for better ways to keep data secure and meet the compliance regulations of their industries.

By incorporating a gateway into the managed file transfer process, not only can internal staff's time and effort be redirected, customers and trading partners can feel confident that the files they exchange with organizations equipped with a gateway will be safe.

Gateways both improve security and streamline file transfers since files do not need to be staged in the DMZ.

Keep Sensitive Data Out of the DMZ

GoAnywhere Gateway gives you the additional layer of security you need.
